

HORIZONTAL STACK LOADER UN-LOADER

The LYNK range of handling modules have been designed to allow total process integration and automation. This unit can be programmed or configured to provide any of the following functions and features.

- Integral drive
- Shaft driven
- Inner layer capability
- Load and unload (buffering) capability
- Panel counter
- Load and unload trolley
- Panel thickness and misfeed sensors
- Integral control
- Remote control

Should these features not include your requirements Cemco-Fsl offer a custom build service.

TYPICAL APPLICATIONS

- 1 To automatically load panels onto a conveyorised process line.
- 2 In conjunction with a panel diverter to buffer panels within a process line.

Outputs can be selected to communicate with a central production control computer or SPC data collection.

All current and future LYNK modules are built to strict design rules to allow substitution of modules as process requirements change. Conveyor drive transfer between modules, common service ducts and programmable controllers ensure consistent surface speed and inter-module communication.
